

Practical No.3

MOHAMMAD QASIM

22-08-2025

Objective:

Write an algorithm for finding the frequency of a particular entity(element) in an iterable.

Python Code

```
In [1]: def freq(x,c):  
        count=0  
        for i in x:  
            if i==c:  
                count+=1  
        print("The argument ",c,"in ",x, "is",count,"times")
```

```
In [2]: freq([2,3,4,5,6,5,6,1,5,2,9],6)
```

The argument 6 in [2, 3, 4, 5, 6, 5, 6, 1, 5, 2, 9] is 2 times

```
In [3]: freq("STATISTICS","S")
```

The argument S in STATISTICS is 3 times

Interpretation:

As we can see the frequency of a particular entity in any iterable (list, tuple or string) is can be counted by 'freq' function, by using this function we count the entity '6' of given list [2,3,4,5,6,5,6,1,5,2,9] and element "S" in string "STATISTICS" as (2,3) element respectively.
