

Practical No.5

MOHAMMAD QASIM

30-08-2025

Objective:

Write a program for segregating the even no. and odd number from a series of numbers

Python Code

```
In [3]: def evenodd(*x):  
        even=[]  
        odd=[]  
        for i in x:  
            if i%2==0:  
                even.append(i)  
            else:  
                odd.append(i)  
        print("The segregated Even no.:",even,"and Segregated Odd no.:",odd,"from the given",x)
```

```
In [5]: evenodd(5,4,3,7,9,2,4,7,10)
```

The segregated Even no.: [4, 2, 4, 10] and Segregated Odd no.: [5, 3, 7, 9, 7] from the given (5, 4, 3, 7, 9, 2, 4, 7, 10)

Interpretation:

As we can see the defined function 'evenodd' segregating the odd and even no. with their respective list.
